Install Halto

Beta 0.6.1 · macOS 14 or later · about 2 minutes

The beta isn't signed by Apple yet. You don't need to turn off your Mac's security: you only allow Halto, once.

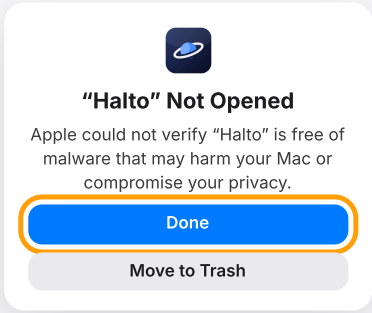

1 Drag Halto to Applications

Open **Halto.dmg** (in Downloads), then drag the Halto icon onto the Applications folder.

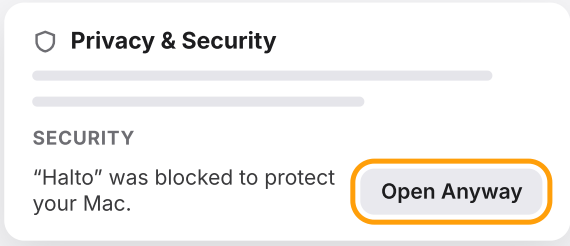

2 Open Halto a first time

Open Halto from Applications. macOS shows this message: click **Done** (not Move to Trash).

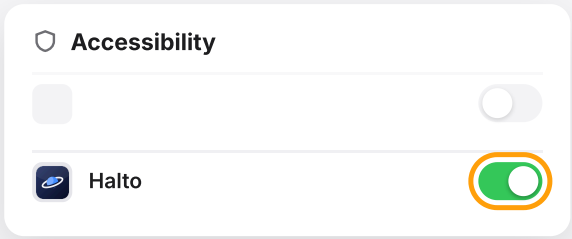

3 Click "Open Anyway"

Open **System Settings › Privacy & Security**, scroll down to **Security**, click **Open Anyway**, then confirm with your password or Touch ID.

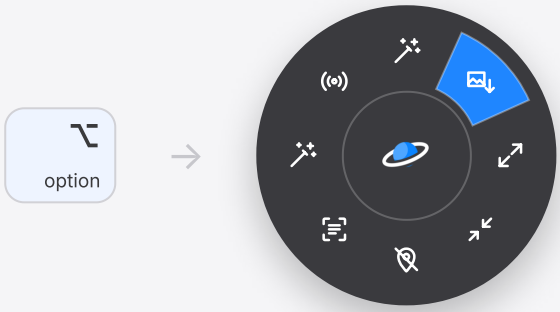

4 Allow Accessibility

Halto asks for it on first launch. In **System Settings › Privacy & Security › Accessibility**, turn **Halto** on. It lets Halto see which file is under your pointer and when you hold the key.

5 Hold ⌥ on a file

In the Finder, point at a file and hold ⌥ **Option**: the wheel opens. Slide toward an action and release. The result appears next to the original, which is never modified.

Optional, only if macOS asks

Automation (Finder): for multiple selections. **Screen Recording**: only for screenshots. Halto works without them.

Something not working?

The wheel doesn't open: check that Halto is on in Accessibility. After an update, switch it off and on again.

"Open Anyway" isn't shown: open Halto once from Applications, then go back to Privacy & Security.

Uninstall: quit Halto from the menu bar and move it to the Trash.
